

### Atom Structure

Diagram

Carbon atom

### Subatomic Particles

Subatomic particle	Location	Mass	Charge
Proton	Nucleus	1	+1
Neutron	Nucleus	1	No charge
Electron	Shells	0 (negligible)	-1

### Atom Symbols

Bigger number is the mass number.  
To find neutrons subtract the smaller number

Atomic number is the number of protons in the atom's nucleus

Symbol is used as a short-hand and in chemical equations

Mass number is the number of protons and neutrons in the nucleus

### History of Atom

Dalton  
Solid sphere

Thomson  
Protons/  
electrons randomly  
arranged

Rutherford/Bohr  
Positive nucleus  
with electrons  
around

### Modern Periodic Table

- Arranged by increasing atomic mass (proton number) in rows called periods
- Metals on the left, non-metals on the right

### Isotopes

- Elements with the same number of protons but different numbers of neutrons
- This explains why relative atomic mass ( $M_r$ ) isn't always a whole number

35  
**Cl**  
17

+

37

↓

35.5  
**Cl**  
17

**H** - e.g.  $M_r$  of Cl is calculated using  
The abundance of each of the  
Atomic masses of the isotope  
 $(35 \times 75/100) + (37 \times 25/100) = 35.5$

### History of Periodic table

- Dimitri Mendeleev was the first to publish an organised table of elements
- He arranged by relative atomic mass
- But he also left gaps so that elements with similar properties were in the same group
- Using the gaps he was able to predict elements that had not been discovered yet

### Electronic Configuration

- Using the rules to draw the first 20 elements
- Rule 1

- Rule 2/3

	Group								Number of occupied energy levels
	1	2	3	4	5	6	7	0	
Period 1								2 He	1
Period 2	3 Li 2.1	4 Be 2.2	5 B 2.3	6 C 2.4	7 N 2.5	8 O 2.6	9 F 2.7	10 Ne 2.8	2
Period 3	11 Na 2.8.1	12 Mg 2.8.2	13 Al 2.8.3	14 Si 2.8.4	15 P 2.8.5	16 S 2.8.6	17 Cl 2.8.7	18 Ar 2.8.8	3
Period 4	19 K 2.8.8.1	20 Ca 2.8.8.2							4
	1	2	3	4	5	6	7	8	

Number of electrons in highest occupied energy level (except for helium)

### Ions

- Atoms are more stable with full outer electron shells
- Metals lose electrons resulting in a positive ion. E.g. sodium in group 1 → Na<sup>+</sup> ion and calcium in group 2 → Ca<sup>2+</sup> ion
- Non-metals gain electrons resulting in a negative ion, e.g. oxygen in group 6 → O<sup>2-</sup> ion and chlorine in group 7 → Cl<sup>-</sup> ion

### Ionic Compounds

- Positive and negative ions arrange in a regular lattice
- This explains properties including ability to dissolve, conduct electricity when dissolved/molten but not solid, high melting & boiling points

### Fullerenes, Allotropes

#### C60

Strong, weak intermolecular forces (like graphite)

Can be used as lubricants

#### Graphene

Strong, light, good electrical conductor

Can be rolled into tubes

Fullerenes C60

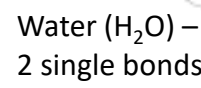

### Ionic Bonding

- Positive and negative ions are attracted and form a compound
- Compound name -ide with 2 elements, -ate with 3 elements including oxygen
- Use the crossover method to determine the formula

### Covalent Bonding

- Electrons are shared to complete the outer shell
- Simple molecular, strong bonds between atoms
- Weak between molecules → gases at room temp

### Metallic Bonding

- Metal atoms lose electrons to become positive ions surrounded by a sea of free electrons
- Allows metals to conduct electricity/heat and be malleable

### Bonding Models

Ball and stick models are limited: they don't show electrons and appear to have large gaps between atoms. Dot and cross diagrams are limited: they are 2D and don't show bond angles.

### Giant Covalent Structures, Allotropes

- Bonding between many non-metal atoms
- Diamond, each C atom forms 4 bonds
- Rigid, strong and doesn't conduct electricity
- Used for cutting tools
- Graphite, each C forms 3 bonds leaving a free electron and weak bonds between layers
- Soft, good electrical conductor - Used as a lubricant

### Conservation of mass

- In a closed system the total mass of the reaction before and after doesn't change
- This is because no atoms are destroyed or created, they are just rearranged
- If mass goes up it's because one of the reactants has joined from the air
- If mass goes down it's because a gas has been released

### H - Moles

- A mole is an amount of particles equal to Avogadro's constant ( $6.02 \times 10^{23}$ )
- One mole of any substance will have a mass in grams equal to the relative particle mass ( $A_r$  or  $M_r$ ) for the substance
- The number of particles of substance in a given mass of that substance can be found by using the 1<sup>st</sup> equation to find the number of moles and the 2<sup>nd</sup> equation to find the number of particles

### Relative Masses ( $M_r$ )

- To find  $M_r$  add the relative atomic mass ( $A_r$ ) of the elements making up a compound

### Calculating Concentration

- The more solute dissolved in in a given volume, the more crowded the particles are = more concentrated
- Volume must be in  $g/dm^3$
- 1 gram dissolved in 1  $dm^3$  = 1  $g/dm^3$  concentration

### Calculating Reacting Masses

- In reactions there will be a limiting reactant which is used up, other reactants are in excess
1. Write out the balanced equation
  2. Work out  $M_r$  of the reactant and product you're interested in
  3. Divide both by the  $M_r$  of the limiting reactant
  4. Multiply both by the given mass of the limiting reactant
- To find the mass of limiting reactant needed to make a certain mass of product
1. Write out the balanced equation
  2. Work out the  $M_r$  of the reactant and product you're interested in
  3. Divide both by the  $M_r$  of the product
  4. Multiply both by the given mass of the product

### Empirical Formulae

- Tells you the smallest ratio of atoms in a compound
- To find it divide the molecular formula by the highest common multiple

Compound	Molecular Formula	Empirical Formula
Butane	$C_4H_{10}$	$C_2H_5$
Octane	$C_8H_{18}$	$C_4H_9$

- Use empirical formula along with  $M_r$  to find molecular formula, divide  $M_r$  of the compound by the  $M_r$  of the empirical formula, then multiply everything in the empirical formula by 2

### Experimental Technique

If 9.6g of Mg reacts with 6.4g of O:  
 $9.6 / 24$  ( $A_r$  Magnesium) = 0.4  
 $6.4 / 16$  ( $A_r$  Oxygen) = 0.4

Ratio 0.4 : 0.4 or 1:1 (MgO)

### H - Balancing Equations with Reacting Masses

1. Divide mass of each substance by  $M_r \rightarrow$  moles
2. Divide all moles by the smallest number of moles
3. Multiply by an amount to make them all whole numbers
4. Write a balanced equation using these numbers
